How to read this report

This report compares what your instrument measured against the colours the chart was designed to have. Every number is a colour difference (ΔE_{00}): 0 is a perfect match, 1–2 is barely visible, and 10+ is clearly wrong.

- Colour accuracy — the ΔE_{00} across the patches, split so you can see the bulk of the chart (all patches and the best 95%) apart from the few hardest patches (the worst 5%). Each metric is judged against your Pass thresholds.
- Paper white & darkest black — the brightest and deepest patches (L^*), a quick health check of your paper and maximum ink.
- Cube corners — paper white, composite black and the six primary and secondary inks. These say as much about your inks as about the instrument.

On a printer a single ΔE against the design isn't meaningful on its own — a printer doesn't reproduce sRGB. But the design reference never changes, so comparing dated reports of the same chart is a clean drift signal. Save a report after each measurement to build that history. Screen and print colours here are approximate; the numbers come from your measurement file and are exact.

Report Results

The following results are extracted from section "Colour accuracy" for each measurement run included for this report.

Metric	2026-07-20
Average ΔE , all patches	Pass
Average ΔE , lowest 95%	Pass
Average ΔE , highest 5%	Pass
Maximum ΔE , all patches	Pass
Maximum ΔE , lowest 95%	Pass

Trend over time (this printer)

A rising average or shifting white/black/colour over time points to ageing inks, printer drift, or instrument drift.
